# 1. Process Modeling Quality

Why we need quality standard?

- ⌘ It is **useful to have some standards** and measures of quality as it relates to process modeling.
- ⌘ Model Quality:
  - ⌘ Accuracy
  - ⌘ Amount of detail
  - ⌘ Completeness of the model

- ⌘ The use of models → to describe what is happening during the process.
- ⌘ These models are often called “as is” models → based on the decisions made previously regarding which methodologies and techniques

The model created **should have sufficient** detail:

business environment

- customers, suppliers, external events or market pressures

organizational structure

- hierarchical or functional view of the organization and how the people work together

functional or departmental structure of the organization

- how the functions or departments work together in the process

business rules

- control the decisions that are made during the process and workflow

activities or actions

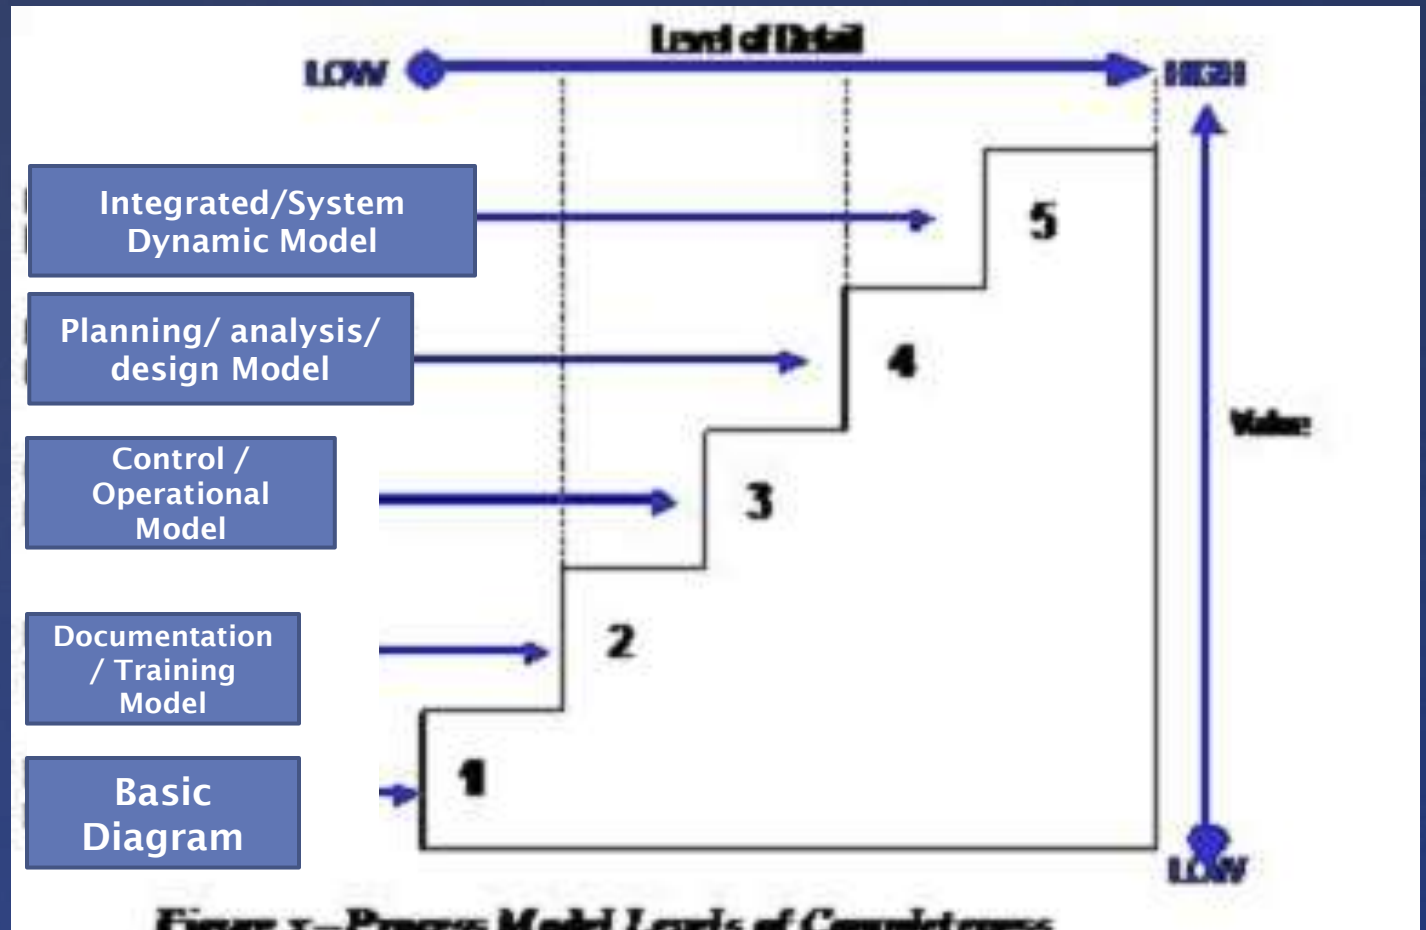

- take place within the process and who does those actions

- ⌘ During the modeling of a process:
  - ⌘ several **disconnections, restrictions, and/or barriers** may become apparent.
  - ⌘ It will help **create a common understanding** of the current state.

# Restrictions

example quality matrix for process models

### ↳ Level 1 - Basic Diagram

- ⌘ one or more graphical depictions-diagrams
- ⌘ may be process flow or a hierarchy of activities or both
- ⌘ cannot deviate too radically from BPMN notation standards
- ⌘ may be in either drawing tool (Using the company BPMN stencil) of Company Standard Tool

### ↳ Level 2 - Documentation/Training

#### ↳ the model:

- ⌘ must follow company running standards
- ⌘ may be in either accepted drawing tool or Company Standard Tool
- ⌘ should have at least one process flow diagram at the activity or task level

#### ↳ all diagram must:

- ⌘ have a diagram title at the top of the page
- ⌘ contain the date, version and other document control information
- ⌘ adhere to company minimum standards
  - ↳ A unique title that follows the company running standards
  - ↳ use the BPMN notation

example quality matrix for process models (2)

↳ All Process objects:

- ∅ Major processes down through activities require a description - a clear description explaining of what work is done
- ∅ tasks require procedural documentation

↳ **Level 3 - Control/Operational**

- ∅ all documentation/training standards plus:
- ∅ all diagrams:
  - ∅ are assigned to a subject area
- ∅ all Process objects on the diagram have:
  - ∅ defined purpose and description

example quality matrix for process models (3)

- ⌘ **Validation** → compare simulated outputs to real-world results (using simulation).
- ⌘ Any salient differences should be **understood and corrected** before **detailed analysis**.
- ⌘ Another way to validate model:
  - ⌘ collect a group of people who work in the process and simulate the process by having one person in the group describe each activity and its product(s)

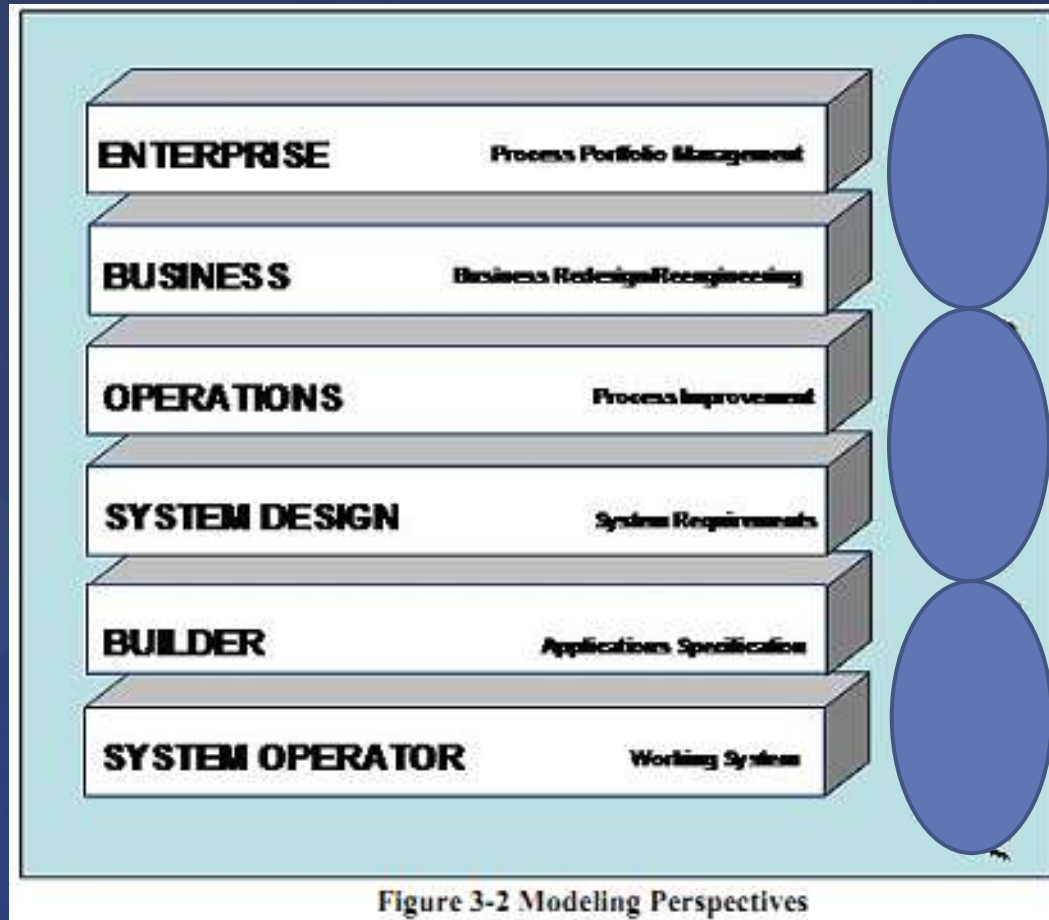

# Model Validation and Simulation

## 2. Modeling Perspectives

- ⌘ Process modeling has been used for:
  - ⌘ **strategic planning**,
  - ⌘ improving **operations**, and
  - ⌘ **specifying information** and applications system requirements

example  
representation of  
the different  
perspectives

# Modeling Perspectives

## Enterprise Domain

- see how the enterprise *operates overall* and that the primary processes

## Business Domain

- view *supports each of the process owners*, who is accountable for and has the authority to address overall process performance.

## Operations Domain

- responsible for *monitoring performance* and look for ways to *continuously improve* operational performance

## Systems Domain

- how *work gets done and how the systems support* that work is the systems perspective

## Builder and Operator

- support *the individuals who have to build all of the support systems* to enable work and to operate the systems

## 3. Levels of models

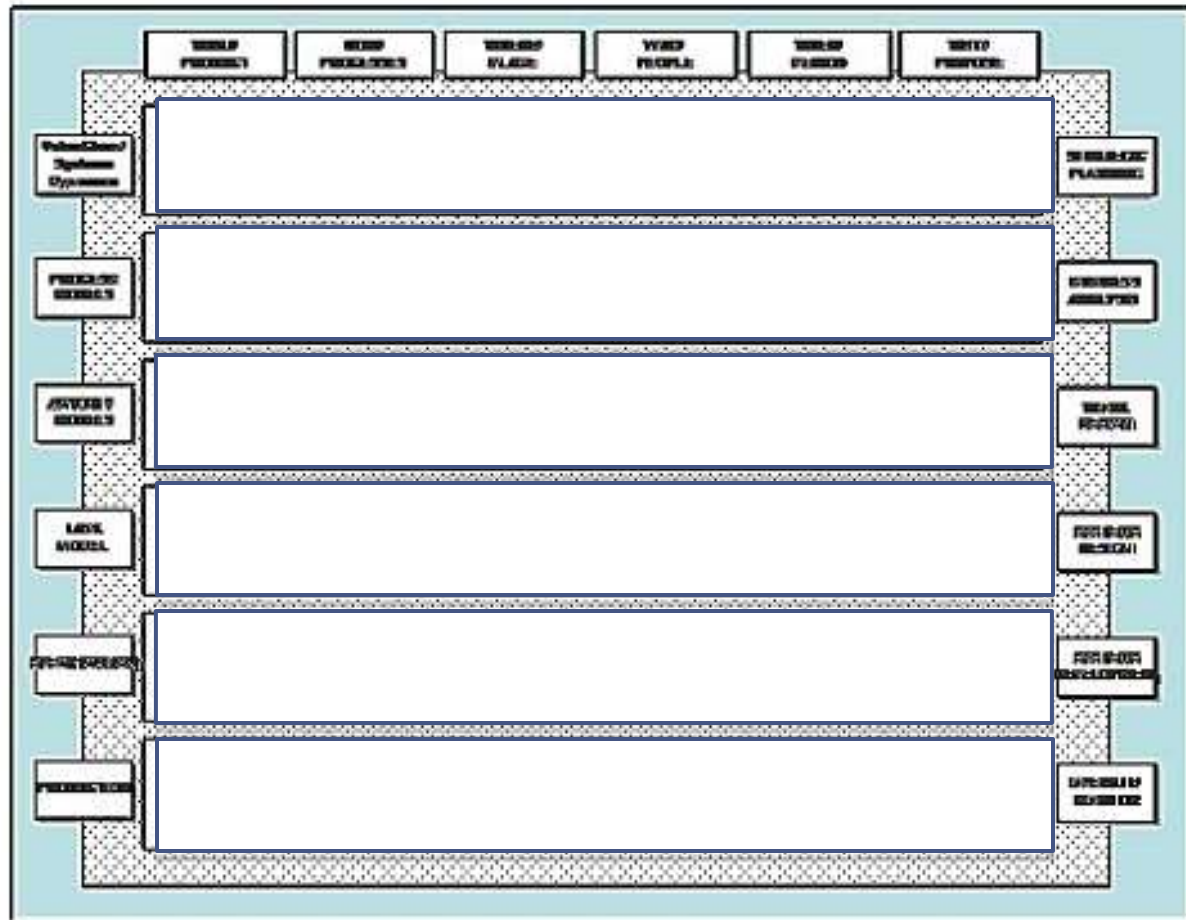

Figure 3-3 is an example of a process model repository structure with example labels for the types of models and their usage.

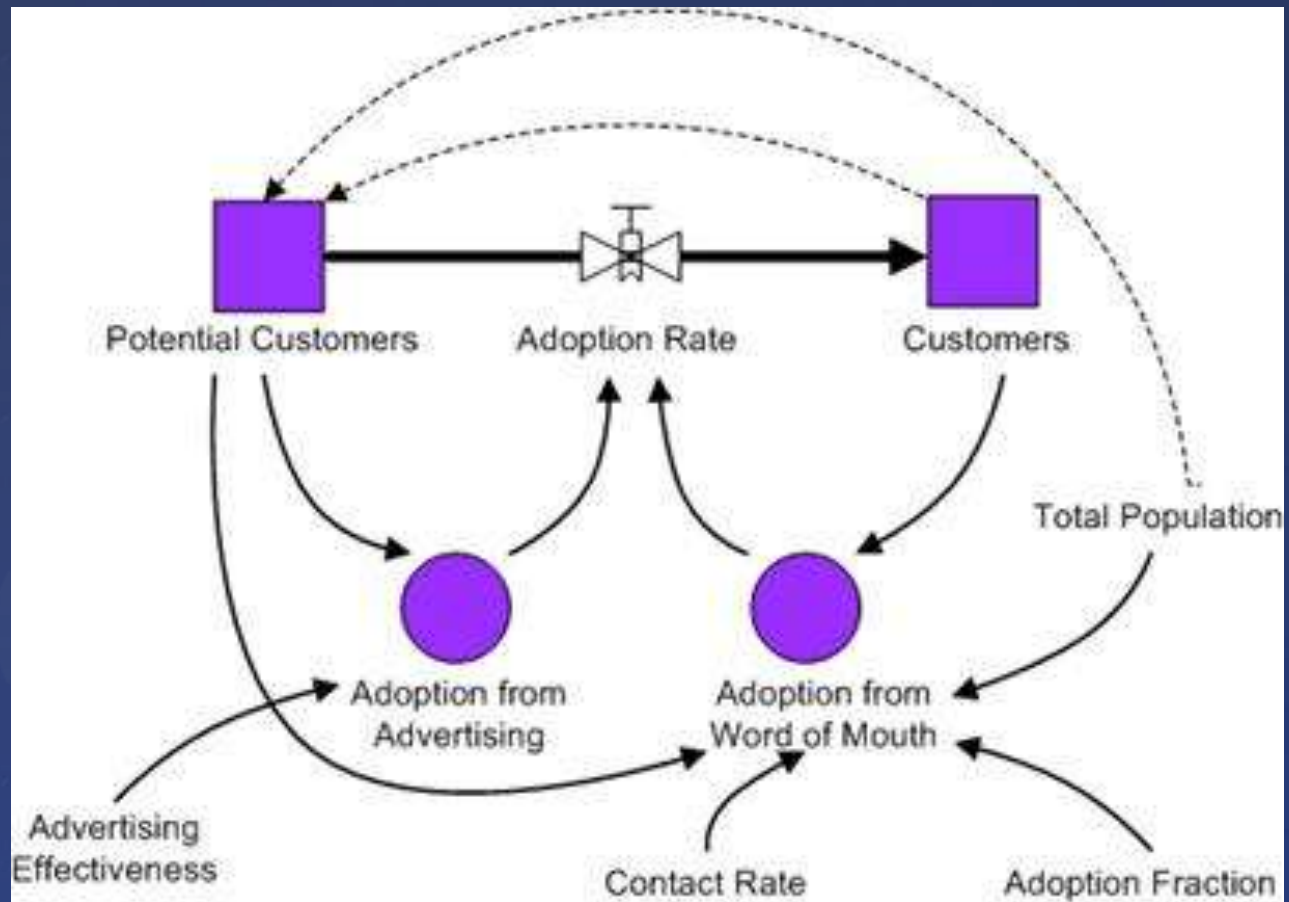

## ↳ Enterprise

- ⌘ An enterprise view model is typically a **highly abstracted** business classification model
- ⌘ These models typically **organize processes into categories** such as primary, support, and management
- ⌘ The processes may be **mapped to Key Performance Indicators (KPIs) and strategic goals** in a process portfolio and used to prioritize resources and project efforts.
- ⌘ They may be **mapped into a System Dynamics type model** to formulate strategies for alternate future scenarios or to develop high level estimates and forecasts

## ↳ Example of Business Process KPI

- ⌘ Percentage of processes where completion falls within +/- 5% of the estimated completion
- ⌘ Average process overdue time
- ⌘ Percentage of overdue processes
- ⌘ Average process age
- ⌘ Percentage of processes where the actual number assigned resources is less than planned number of assigned resources
- ⌘ Sum of costs of “killed” / stopped active processes
- ⌘ Average time to complete task
- ⌘ Sum of deviation of time

# Example of KPI

# What is System Dynamic?

## ↳ Business Models

- ⌘ Business models depict the **major events, activities, and results**
- ⌘ Describe:
  - ↳ end-to-end processes,
  - ↳ their sub-processes, and
  - ↳ their interactions with their environment

## ↳ Operations and Work Flow

- ⌘ These are detailed models **mapped down to activity, task, and procedural level details** and describe the **physical implementation** details of the operating processes.

## ↳ System

⌘ depict the **triggering events, software processes, data flows, and system outputs** required

## ↳ Measurement and Control

⌘ indicate points in the **operation where key performance measure and control points** are monitored

Approach

## 4. Modeling Approaches

- ⌘ There are a number of approaches to process modeling:
  - ⌘ top-down, middle-out, or bottom-up
- ⌘ The approach used varies **depending on the purpose and the scope** of the effort.
- ⌘ The key is to determine the purpose of the modeling effort and then apply the best approach for that purpose.

# 5. Capturing Information

## ↳ Direct Observation

↳ is a good way to document current **procedural detail**.

↳ Direct observation also entails the risk of the **performers doing what they think you want to see** rather than what they normally do

## ↳ Interviews

↳ requires **minimal time** and **disruption of normal duties** from the participants.

↳ generally **requires follow up** and sometimes **doesn't uncover all of the activities** to completely describe the process

## ↳ Survey/Written Feedback

- ⌘ requires **minimal time** and **disruption of duties**
- ⌘ require **follow up**

## ↳ Structured workshops

- ⌘ Structured workshops are **focused, facilitated meetings** where enough subject matter experts and stakeholders are **brought together** to create the model interactively.
- ⌘ **shortening the elapsed calendar time** required to develop the models and **gives a stronger sense of ownership** to the workshop participants than other techniques
- ⌘ require **less follow up** and **generate a commonly agreed upon** with higher quality than other techniques
- ⌘ workshops may be **more costly** than other methods

## ⌘ Web-Based Conferencing

- ⌘ to gain much the **same benefits as face-to-face workshops**, but **work best** with smaller groups
- ⌘ **more convenient** and **less expensive**
- ⌘ it can be **more difficult to monitor** and **manage individual participation**
